UV STERILIZER FOR PHONES AND OTHER ITEMS
 A UV sterilizer is a small device that uses UV light to kill various types of germs (including viruses and bacteria).
 The device has a special chamber lit with UV lamps, in which we can place the phone (or any other object, such as glasses, a mask) for its disinfection. In addition, we have an aromatherapy function at our disposal, which will give our items a nice, fresh fragrance at our discretion. This product is a multi-functional UV sterilizing device with separate disinfection and aromatherapy function. Ultraviolet (UV) light is being used for sterilization in order to kill bacteria /viruses etc on the sterilized product. Special device construction and light placement guaranties 360° UV penetration area without dead space. Special elevating pads on the bottom allows the UV light to penetrate the surface under the sterilizing object. Ultraviolet is relatively healthy and environmental friendly way of sterilization. It is used in medical, health care, food industry, electronics, agriculture, etc. to protect products in wide range of applications. There are two UV lamps in the device. 3 minute exposure (default device working time) should eectively kill viruses (like coronavirus) and bacteria (like escherichia coli, albicans, staphylococcus) and other common microbes. For the best result it is recommended to turn the sterilizing product up-side-down and start the sterilizing process again. This is especially recommended for irregular cloth products. To phone: max. 16.5 cm high

Specification

Warranty: 12 month
